

The image features three white modular electrical components against a vibrant blue background with light streaks. In the upper left, a switch with a single rocker and a small circular indicator is shown. In the lower left, another switch with a similar design but a different rocker shape is visible. On the right, a larger module contains two switches (one with a red indicator) and a three-hole electrical outlet. The CPL logo is embossed on the bottom left of this module.

CPL presents UREKA

Modular Switches with Life-saving Properties

UREKA MODULAR SWITCHES

CRAFTED FROM "UREA FORMALDEHYDE" ~
ACCEPTED INTERNATIONALLY FOR ITS SUPERB FIRE-RETARDING PROPERTIES

ONE MODULE SWITCHES

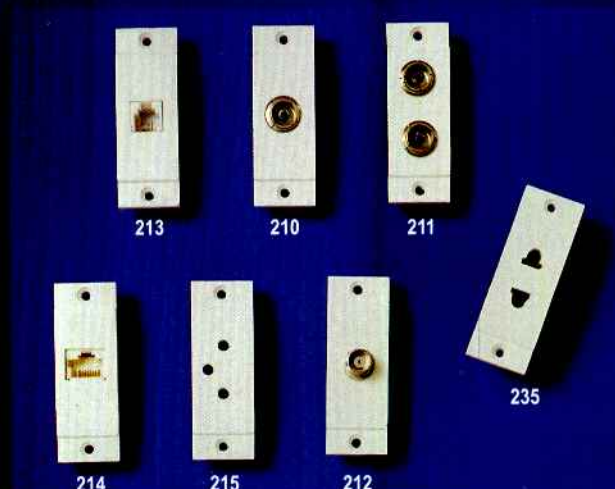

UREKA follows the world's highest standards of **safety**. Made from Urea Formaldehyde, UREKA has very high fire-retarding properties and is **100% shock-proof**. The non-recycled raw material keeps the lustrous surface free from ugly scratches. So you have switches that are down-to-earth functional and **good-looking**, too. (To achieve extra economy, you may even fix individual modules directly on any surface such as wood, acrylic, etc - without a base plate)

UREKA is composed using the best available components including solid, pure brass terminals and silver cadmium-oxide contacts. The rocker operation is tested on load for over 40,000 on-off operations, while the Glow Wire Test ensures that even at 850° celsius, UREKA does not emit hazardous flames, or thick smoke (which incidentally is the chief cause of death) during an overload, or electrical short-circuit.

What's more, UREKA's fuse-equipped plugs protect your expensive appliances and the **child-proof shutters** on its sockets, protect your precious little ones from accidental electrocution.

So when UREKA's **modular technology** is well-researched, and its safety adheres to IS and BS quality standards, why settle for less?

why compromise?
